

Litmos AI Recommendations

In a recent research report by Deloitte “The Contextualization of Learning Content,” data indicates that content is no longer the problem for learners. In fact, content is everywhere. But this same proliferation of information has made it harder for L&D to provide context for that content and to make it useful.

Two key challenges keeping workers from gaining critical skills and knowledge are the overwhelming volume of content that makes it difficult to notice and keep track of useful information, and the lack of effective tools that makes it difficult for employees to find the most needed information.

Companies can overcome this challenge with a learning recommendation engine that draws insights from historical user behavior and content metadata to deliver highly personalized learning recommendations for each user.

Litmos AI Recommendations connects employees with targeted learning to support their goals and situation, enabling them to upskill.

Currently available for Litmos clients in the US and soon to be available in the EU, this powerful recommendation engine enables organizations to:

Make better use of vast amounts of relevant and current learning content

Consistently and continually develop talent to build a stronger workforce

Create a culture of learning enriched with real-time recommendations

Empower learners to make personalized choices based on prior interactions

Protect learner and organizational security by not storing or using any PII data

Equally leverage Litmos Training Content and proprietary content
